# Sample Paper-02 <br> Chemistry (Theory) <br> Class - XI 

## Time allowed: $\mathbf{3}$ hours

Answers
Maximum Marks: 70

1. 1 L of nitrogen will react with 3 L of hydrogen,

2L of nitrogen will react with 6L of hydrogen, but we have 2L of hydrogen, therefore hydrogen is limiting reactant.
So, 3L of hydrogen gives 2L of ammonia,
2 L of hydrogen gives $\frac{2}{3} \times 2=\frac{4}{3}=1.33 \mathrm{~L}$ of ammonia.
2. $\Delta \mathrm{H}$, the enthalpy change and $\Delta \mathrm{U}$, the internal energy change are state functions as they depend on initial and final state and note on the path.
3. It is because acetone has weak van der Waals' forces of attraction whereas water molecules have strong hydrogen bonding, therefore, $\Delta_{\text {vap }} \mathrm{H}^{0}$ of water is more.
4. 1 molecule of methane $=6+4=10$ electrons

16 of methane contains $10 \times 6.022 \times 10^{23}$ electrons $=6.022 \times 10^{24}$ electrons.
5. $\quad 1000 \mathrm{~cm}^{3}$ of $0.15 \mathrm{M} \mathrm{Na}_{2} \mathrm{CO}_{3}$ contains 0.15 moles of $\mathrm{Na}_{2} \mathrm{CO}_{3}$

So, $100 \mathrm{~cm}^{3}$ of $0.15 \mathrm{M} \mathrm{Na}_{2} \mathrm{CO}_{3}$ will contain $=\frac{0.15 \times 100}{1000}$
$=0.015$ moles of $\mathrm{Na}_{2} \mathrm{CO}_{3}$
Number of moles $=\frac{\text { Mass }}{\text { Molar mass }}-$
$\therefore 0.015=\frac{\text { Mass }}{106 \mathrm{~g}}$
Molar mass of $\mathrm{Na}_{2} \mathrm{CO}_{3}=105 \mathrm{~g}$
$=0.015 \times 106=1.59 \mathrm{~g}$
6. As we go away from the nucleus, the effective nuclear charge pull goes on increasing. Hence electrons present in 4 p orbital experience the lowest effective nuclear charge.
7. (a) $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}-\mathrm{CH}_{3}$
(b) $\mathrm{CH}_{3}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}_{3}$

Or

8. (a) Wavelength decreases with increase in velocity of moving particle.
(b) Angular momentum of 3 p and 4 p orbitals will be same because $\mathrm{l}=1$ for p -orbital.
9. The metals of groups 7, 8 and 9 do not form hydrides. This region of periodic table from group 7 to 9 is referred to as hydride gap. Heavy water is used in the niclear reactors to slow down the speed of neutrons (as moderator).
10. Carbon dioxide absorbs IR radiations from atmosphere which lead to global warming. So, if carbon dioxide level increases beyond $0.03 \%$, the natural greenhouse balance may get disturbed. So it is considered as serious pollutant.
11. (a) BOD is a measure of level of pollution caused by organic biodegradable material. Low value of BOD means water is less polluted.
(b) 1 ppm is desirable concentration of fluoride ions in drinking water. The pH of drinking water should be between 5.5-9.5.
(c) Nitrogen dioxide is extremely toxic o living tissues and harmful to plants, paints, textiles and metals. It causes acid rain. It produces photochemical smog.
12. (a) (i) The properties which denend only on the nature of the substance and not on the amount of the substance are called intensive properties. Example: Density.
(ii) A process in which no heat flows between the system and the surroundings is called an adiabatic process i.e. $\mathrm{q}=0$.
(b) Change in Gibbs energy, $\Delta \mathrm{G}=\mathrm{G}_{2}-\mathrm{G}_{1}$,

Enthalpy change, $\Delta \mathrm{H}=\mathrm{H}_{2}-\mathrm{H}_{1}$,
Entropy change, $\Delta \mathrm{S}=\mathrm{S}_{2}-\mathrm{S}_{1}$,
$\Delta \mathrm{G}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}$
$\Delta \mathrm{S}_{\text {total }}=\Delta \mathrm{S}_{\text {system }}+\Delta \mathrm{S}_{\text {surrounding }}$
$\Delta \mathrm{S}_{\text {total }}=\Delta \mathrm{S}_{\text {system }}-\frac{\Delta \mathrm{H}_{\text {sys }}}{\mathrm{T}}$
$\Delta \mathrm{S}_{\text {total }}=\Delta \mathrm{S}-\frac{\Delta \mathrm{H}}{\mathrm{T}}$

Multiply by T,
$\mathrm{T} \Delta \mathrm{S}_{\text {total }}=\mathrm{T} \Delta \mathrm{S}-\Delta \mathrm{H}$
$\mathrm{T} \Delta \mathrm{S}_{\text {total }}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}=\Delta \mathrm{G}$
Therefore, $\Delta \mathrm{G}=-\mathrm{T} \Delta \mathrm{S}_{\text {total }}$
13. (a) Using CNG as a fuel, using public transports, electric cars and bicycles and avoiding burning of dry leaves, plastic bags etc.
(b) Banning CFCs used in refrigerators, AC etc., and using less amount of diesel and petrol.
(c) Yes. Solar energy reduces pollution. By making green building, a lot of natural light and natural cooling and heating takes place which save lot of energy and environment.
14. It represents the graph between $p$ and $1 / V$. It is a straight line passing through origin. However at high pressures, gases deviate from Boyle's law and under such conditions a straight line is not obtained in the graph.
15. $\quad$ Molarity $=3 \mathrm{M}$

Density $=1.25 \mathrm{~g} / \mathrm{mL}$
Mass of NaCl in 1 L solution
$=$ Molarity x molar mass $=3 \times 58.5=175.5 \mathrm{~g}$
Density = Mass/Volume
Mass of 1 LNaCl solution $=1.25 \times 1000 \simeq 12.50 \mathrm{~g}$;
Mass of water in solution $=1250-175.5=1074.5 \mathrm{~g}=1.0745 \mathrm{~kg}$
Molality $=$ No. of moles of solute/Mass of water
$=\frac{3}{1.0745}=2.79 \mathrm{~m}$
16. (a) Combustion of methenol:
$\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) ; \Delta \mathrm{H}=-726 \mathrm{~kJ} / \mathrm{mol}$
(b) Enthalpy of formation of carbon dioxide:
$\mathrm{C}_{(\text {graphite })}+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) ; \Delta \mathrm{H}=-393 \mathrm{~kJ} / \mathrm{mol}$
(c) Enthalpy of formation of water:
$\mathrm{H}_{2}(\mathrm{~g})+1 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) ; \Delta \mathrm{H}=-286 \mathrm{~kJ} / \mathrm{mol}$
(d) Required reaction:
$\mathrm{C}_{\text {(graphite) }}+2 \mathrm{H}_{2}(\mathrm{~g})+1 / 2 \mathrm{O}_{2} \rightarrow \mathrm{CH}_{3} \mathrm{OH}(\mathrm{l}) ; \Delta \mathrm{H}=$ ?
$\Delta \mathrm{H}=(-572-393)-726=-239 \mathrm{~kJ} / \mathrm{mol}$
17. (a) It is used in water softening, laundering and cleaning.
(b) It is used in the manufacture of glass, soap, borax and caustic soda.
(c) It is used in paper, paints and textile industries.
(d) It is an important laboratory reagent both in qualitative and quantitative analysis.
18. Elements in and beyond the third period of the periodic table have, apart from $3 s$ and $3 p$ orbitals, $3 d$ orbitals also available for bonding. In a number of compounds of these elements there are more than eight valence electrons around the central atom. This is termed as the expanded octet. Obviously the octet rule does not apply in such cases. Some of the examples of such compounds are: $\mathrm{PF}_{5}, \mathrm{SF}_{6}, \mathrm{H}_{2} \mathrm{SO}_{4}$ and a number of coordination compounds.

19. Dihydrogen gas adds to alkenes and alkynes in the presence of finely divided catalysts like platinum, palladium or nickel to form alkanes. This process is cailed hydrogenation. These metals adsorb dihydrogen gas on their surfaces and activate the hydrogen - hydrogen bond. Platinum and palladium catalyses the reaction at room temperature but relatively higher temperature and pressure are required with nickel catalysts.

$$
\begin{aligned}
& \mathrm{CH}_{2}=\mathrm{CH}_{2}+\mathrm{H}_{2} \xrightarrow{\mathrm{Pt} / \mathrm{Pd} / \mathrm{Ni}} \mathrm{CH}_{3}-\mathrm{CH}_{3} \\
& \mathrm{CH}_{3}-\mathrm{CH}=\mathrm{CH}_{2}+\mathrm{H}_{2} \xrightarrow{\mathrm{Pt} / \mathrm{Pd} / \mathrm{Ni}} \mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{3}
\end{aligned}
$$

20. 

(a) $\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq}) \Leftrightarrow \mathrm{NH}_{4}^{+}(\mathrm{aq})+2 \mathrm{H}^{-}(\mathrm{aq})$

$$
\begin{aligned}
& \quad \frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{4} \mathrm{OH}\right]} \\
& \mathrm{K}_{\mathrm{b}} \\
& {\left[\mathrm{NH}_{4}^{+}\right]=\left[\mathrm{OH}^{-}\right]} \\
& {\left[\mathrm{NH}_{4} \mathrm{OH}\right]=0.1 \mathrm{M}} \\
& \mathrm{~K}_{b}=\frac{\left[\mathrm{OH}^{-}\right]^{2}}{\left[\mathrm{NH}_{4} \mathrm{OH}\right]} \\
& {\left[\mathrm{OH}^{-}\right]^{2}=1.8 \times 10^{-5} \times 0.1} \\
& =0.18 \times 10^{-5} \\
& \therefore\left[\mathrm{OH}^{-}\right]=1.34 \times 10^{-3} \mathrm{~mol} / \mathrm{L}
\end{aligned}
$$

(b) $\mathrm{AgCN} \Leftrightarrow \mathrm{Ag}^{+}+\mathrm{CN}^{-}$

Let $\mathrm{x} \mathrm{mol} / \mathrm{L}$ be the solubility of AgCN
Thus $\left[A g^{+}\right]=x$
$\left[C N^{-}\right]=x$
$K_{S P}=\left[\mathrm{Ag}^{+}\right]\left[\mathrm{CN}^{-}\right]=\mathrm{X}^{2}$
$x=\sqrt{K_{S P}}$

$$
=\sqrt{6.0 \times 10^{-17}}
$$

$=7.75 \times 10^{-9}$
$\mathrm{Ni}(\mathrm{OH})_{2} \Leftrightarrow \mathrm{Ni}^{2+}+2 \mathrm{OH}^{-}$
Let $\mathrm{y} \mathrm{mol} / \mathrm{L}$ be the solubility of $\mathrm{Ni}(\mathrm{OH})_{2}$
Thus $\left[\mathrm{Ni}^{2+}\right]=y \&\left[\mathrm{OH}^{-}\right]=2 y$

$$
K_{S P}=\left[\mathrm{Ni}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}
$$

$$
=y x(2 y)^{2}=4 y^{3}
$$

$$
y=\left(\frac{K_{S P}}{4}\right)^{1 / 3}
$$

$$
y=\left(\frac{2 x 10^{-1}}{4}\right)^{1 / 3}
$$

$$
y=\sqrt[3]{0.5 \times 10^{5}}
$$

Since solubility of $\mathrm{Ni}\left(\mathrm{OH}_{2}\right)_{2}$ is wore than $\mathrm{AgCN}, \mathrm{Ni}(\mathrm{OH})_{2}$ is more soluble than AgCN .
Or
(a) Here, $\mathrm{HCOO}^{-}$is common ion. So when small amount of hydrogen ions are added, it combines with HCOO which are in excess to form HCOOH and $\mathrm{H}^{+}$remains the same. So pH remains constant. When a small amount of hydroxide ions are added, hydroxide ions take up hydrogen ions and so dissociation of HCOOH will increase so as to maintain concentration of hydroxide ions. So pH is not affected.
(b) Here, ammonium ions are common ions. So when a small amount of hydrogen ions are added, hydrogen ion will take up hydroxide ion and dissociation of ammonium hydroxide will increase so as to maintain hydroxide constant. So, pH remains constant. When a small amount of hydroxide ions are added, ammonium ions which are in excess will combine
with hydroxide ions to form ammonium hydroxide back so as to maintain hydroxide constant. So, pH remains constant.
21. (a) Plaster of Paris: $\mathrm{CaSO}_{4} \cdot 1 / 2 \mathrm{H}_{2} \mathrm{O}$
(b) Epsom salt: $\mathrm{MgSO}_{7} \cdot \mathrm{H}_{2} \mathrm{O}$
(c) Calcium carbide: $\mathrm{CaC}_{2}$
(d) Calcium cyanamide: $\mathrm{CaCN}_{2}$
22. $\% C=\frac{12}{44} \times \frac{0.792}{0.43} \times 100=48 \%$
$\% H=\frac{2}{18} \times \frac{0.324}{0.45} \times 100=8 \%$
$M_{1} V_{1}=2 M_{2} V_{2}$
$(\mathrm{NaOH}) \quad\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$
$\frac{1}{10} \times 77=2 \times \frac{1}{8} \times V_{2}$
$V_{2}=30.8 \mathrm{~cm}^{3}$
Volume of $\frac{M}{8} \mathrm{H}_{2} \mathrm{SO}_{4}$ consumed by $\mathrm{NH}_{3}=2(50-30.8)=2 \times 19.2 \mathrm{~cm}^{3}$
$19.2 \mathrm{~cm}^{3}$ of $\frac{M}{8} H_{2} S O_{4}=2 \times 19.2 \mathrm{~cm}^{3}$ of $\frac{M}{8} \mathrm{NH}_{3}$
$\% N=\frac{1.4 \times 2 \times V_{1} \times M_{1}}{W}=\frac{1.4 \times 2 \times 19.2 \times 1}{0.24 \times 8}=25 \%$
23. (a) electrons in presence of oxygen to fcrm. water.
(b) It can be prevented by painting, oiling, greasing and galvanization.
(c) The metal gets oxidised.
24. (a)

| Species | Conjugate Acid | Conjugate Base |
| :---: | :---: | :---: |
| $\mathrm{H}_{2} \mathrm{O}$ | $\mathrm{H}_{3} \mathrm{O}^{+}$ | $\mathrm{OH}^{-}$ |
| $\mathrm{HCO}_{3}^{-}$ | $\mathrm{H}_{2} \mathrm{CO}_{3}^{-}$ | $\mathrm{CO}_{3}^{-}$ |
| $\mathrm{HSO}_{4}^{-}$ | $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $\mathrm{SO}_{4}^{2-}$ |
| $\mathrm{NH}_{3}$ | $\mathrm{NH}_{4}^{+}$ | $\mathrm{NH}_{2}^{-}$ |

(b) For the reaction: $\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightleftharpoons \mathrm{CO}(\mathrm{g})+3 \mathrm{H}_{2}(\mathrm{~g})$
(i) $\mathrm{K}_{\mathrm{p}}=\frac{\left(\mathrm{p}_{\mathrm{CO}}\right)\left(\mathrm{p}_{\mathrm{H}_{2}}\right)^{3}}{\left(\mathrm{p}_{\mathrm{CH}_{4}}\right)\left(\mathrm{p}_{\mathrm{H}_{2} \mathrm{O}}\right)}$
(ii) (a) On increasing pressure, the reaction equilibrium will shift in the backward direction.
(b) There is no effect of catalyst in equilibrium composition; however the equilibrium will be attained faster.

## Or

(a) $\mathrm{NaCN}, \mathrm{NaNO}_{2}-$ Solution are basic as they are salts of strong base and weak acid. (HCN and $\mathrm{HNO}_{2}$ are weak acids and NaOH is strong base). $\mathrm{NH}_{4} \mathrm{NO}_{3}$ - Its solution is acidic as it is salt of strong acid $\left(\mathrm{HNO}_{3}\right)$ and weak base $\left(\mathrm{NH}_{4} \mathrm{OH}\right)$.
(b) KBr - This solution is neutral as it salt of strong acid HBr and strong base KOH.
25.
$\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{3}$ - n-hexane
$\mathrm{CH}_{3}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{3}$ - 2-Methylpentane
$\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}_{2}-\mathrm{CH}_{3}$ - 3-Methylpentane
$\mathrm{CH}_{3}-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}-\mathrm{CH}_{2}-\mathrm{CH}_{3}$-2,2-Dimethylpentane
$\mathrm{CH}_{3}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CH}_{3}$ - 2,3-Dimethylbutane
Or
(a) Wacker's method.
(i) Eco-friendly and safest method.
(ii) It gives $90 \%$ yield.
(b) In Wacker's method,

$$
\begin{aligned}
& \mathrm{R}-\mathrm{CH}=\mathrm{CH}_{2} \xrightarrow{\mathrm{PdCl}_{2} / \mathrm{air}^{2} / \mathrm{Cu}_{2} \mathrm{Cl}_{2}} \mathrm{P}-\mathrm{CO}-\mathrm{CH}_{3} \\
& \mathrm{CH}_{2}=\mathrm{CH}_{2} \xrightarrow{\mathrm{PdCl}_{2} / \mathrm{air}^{2} / \mathrm{Cu}_{2} \mathrm{Cl}_{2}} \mathrm{CH}_{3}-\mathrm{CHO}
\end{aligned}
$$

(c) $\mathrm{HgSO}_{4}$ is unsafe for the environment.
26. Step 1: The skeletal ionic equation is:

$$
\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+\mathrm{SO}_{3}^{2-}(\mathrm{aq}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{SO}_{4}^{2-}(\mathrm{aq})
$$

Step 3: Calculate the increase and decrease of oxidation number, and make them equal:
$\stackrel{+6}{\mathrm{Cr}_{2}} \stackrel{-2}{\mathrm{O}}_{7}(\mathrm{aq})+3{\stackrel{+4}{\mathrm{~S}} \mathrm{O}_{3}}_{3}(\mathrm{aq}) \rightarrow 2{\stackrel{+3}{\mathrm{C}} \mathrm{r}(\mathrm{aq})+{\stackrel{+6}{ } \mathrm{~S}^{-2}}_{4}(\mathrm{aq}) ~}_{\text {a }}$
Step 4: As the reaction occurs in the acidic medium, and further the ionic charges are not equal on both the sides, add $8 \mathrm{H}+$ on the left to make ionic charges equal $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+3 \mathrm{SO}_{3}^{2-}(\mathrm{aq})+8 \mathrm{H}^{+} \rightarrow 2 \mathrm{Cr}^{3+}(\mathrm{aq})+3 \mathrm{SO}_{4}^{2-}(\mathrm{aq})$

Step 5: Finally, count the hydrogen atoms, and add appropriate number of water molecules on the right to achieve balanced redox change.

$$
\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+3 \mathrm{SO}_{3}^{2-}(\mathrm{aq})+8 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 2 \mathrm{Cr}^{3+}(\mathrm{aq})+3 \mathrm{SO}_{4}^{2-}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}
$$

Or
$\mathrm{Pb}_{3} \mathrm{O}_{4}$ is actually a stoichiometric mixture of 2 mol of PbO and 1 mol of $\mathrm{PbO}_{2}$. In $\mathrm{PbO}_{2}$, lead is present in +4 oxidation state, whereas the stable oxidation state of lead in PbO is $+2 . \mathrm{PbO}_{2}$ thus can act as an oxidant (oxidising agent) and, therefore, can oxidiseCl- ion of HCl into chlorine. Since PbO is a basic oxide, the reaction
$\mathrm{Pb}_{3} \mathrm{O}_{4}+8 \mathrm{HCl} \rightarrow 3 \mathrm{PbCl}_{2}+\mathrm{Cl}_{2}+4 \mathrm{H}_{2} \mathrm{O}$ can be splitted into two reactions namely:
$2 \mathrm{PbO}+4 \mathrm{HCl} \rightarrow 2 \mathrm{PbCl}_{2}+2 \mathrm{H}_{2} \mathrm{O}$ (acid-base reaction)
$\begin{array}{llll}+4 & -1 & +2 & 0\end{array}$
$\mathrm{PbO}_{2}+4 \mathrm{HCl} \rightarrow \mathrm{PbCl}_{2}+\mathrm{Cl}_{2}+2 \mathrm{H}_{2} \mathrm{O}$ (redox reaction)
Since $\mathrm{HNO}_{3}$ itself is an oxidising agent therefore, it is unlikely that the reaction may occur
between $\mathrm{PbO}_{2}$ and $\mathrm{HNO}_{3}$. However, the acid-base reaction occurs between PbO and $\mathrm{HNO}_{3}$ as:
$2 \mathrm{PbO}+4 \mathrm{HNO}_{3} \rightarrow 2 \mathrm{~Pb}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{H}_{2} \mathrm{O}$
It is the passive nature of $\mathrm{PbO}_{2}$ against $\mathrm{HNO}_{3}$ that makes the reaction different from the one that follows with HCl .
